

ZCorum™

Increase Success and Profitability for your Broadband Provider Clients

Together with you, we can lay out a Broadband Network program based on your client's particular situation, degree of fiber network experience, and overall goals.

Services:

Broadband Feasibility

If you provide consulting services for broadband providers, your clients count on you to guide them on critical decisions from the technology to use to how their business and community can benefit from that technology. And, it's not just about the network. You can help contribute to their success by recommending services and products that will increase operational efficiency, decrease costs, and improve subscriber satisfaction.

Project Management

With a focus on closing the digital divide in America, service providers are planning to begin or expand their fiber network. And with the many funding opportunities available to internet service providers, today is the time for them to move forward. But the process can be involved and they will look to you for advice and recommendations.

Design & Engineering

Construction

Wherever you are in the process, by working with ZCorum you will exceed their expectations. We will support you at any stage, wherever you need us. If you don't need pre-deployment or deployment services, we're happy to help after the network is built. Our goal is to help you as you help your clients improve the quality of the broadband network and services they provide to their community.

Operational Services

Who are We?

We are your technology partner. We have a strong track record of helping new and existing broadband providers succeed, and are ready to deliver solutions that will do the same for your client. Our services can be configured ala carte or layered to create a suite of services that's optimal for your client's unique needs.

Managed Services

You can be assured we will treat your client's investment as if it were our own. In addition to developing business plans, designing networks and managing construction projects, we can help manage the network and provide ongoing managed services and support after it is up and running.

We're Ready to Help with Some or all of These Services

Broadband Feasibility

With our wide-ranging feasibility study specifically designed to meet the unique needs of your client, we can identify the opportunities for enhanced broadband services delivered to the residents, and determine the technology best suited to support them. Then together we can use our findings to determine if the proposed services are feasible from both a technical and economic standpoint. If the project looks feasible, the information derived from the analysis can be used to develop a detailed business and engineering plan of action.

Project Management

Our team can provide you with real-world broadband deployment solutions for your client. In addition to working to develop a strategic plan and identify the best solution for the network based on the client's requirements, we take into account their current infrastructure, available right of ways, budget, goals and community needs. From there we can develop a project management plan that addresses all of the necessary steps to complete the project in a timely and cost-effective manner.

Design and Engineering

We understand what it takes to design and engineer a broadband solution that can meet your client's unique needs and be implemented in a timely and cost-effective manner. When you partner with us, you'll experience an approach to the network design and deployment that is not cookie cutter but is particular to your client. We're backed by years of experience serving large cities to small townships, co-ops and municipalities, and have the ability to service clients over the life of the deployed network.

Construction

We have the resources available for any size project, and handle all local, state, and federal ordinances and contract requirements. When the project is completed, our state-of-the-art equipment ensures that the network performs at optimum specifications and meets all FCC regulations. We are committed to serving you and your clients with our expertise, experience, quality workmanship and safe construction practices, while meeting any contract agreements and deadlines.

Operational Services

We provide the local resources needed to manage the broadband service, from installing drops and equipment for new subscribers, to maintaining the network and dispatching service technicians if there is a problem. Our operational teams are accountable, and serve with passion and professionalism. We only employ those who take pride in providing outstanding customer service.

Managed Services and End User Support

When your client's broadband network is ready, our managed services and End User Support can help your client operate more efficiently and economically. We provide residential and commercial VoIP, IPTV, hosted email, device provisioning, network monitoring, and engineering assistance in addition to call center service and support.
