

Security Posture Assessment and Penetration Testing Services

Achieving a secure IT infrastructure begins with a clear understanding of your organization's current security posture. To identify your organization's vulnerabilities, a team of security experts will use the same tools and techniques as potential attackers.

Harness cybersecurity expertise to pinpoint and address your security issues, reducing your risks. A comprehensive report will be provided detailing the approach, methodology, key findings, and recommended remediation steps to optimize your IT infrastructure and enhance its resilience against attacks.

Benefits of an Assessment

- Accurately understand your company's security and risk profile
- Comply with information security best practices and industry regulations
- Provides comprehensive and relevant reports to leadership on the organization's risk

We utilize a wide range of tools and methods to meet the unique security requirements of your company:

- Internal Penetration Testing:** Internal systems are analyzed for vulnerabilities and to assess their potential exploitation by attackers.
- External Penetration Testing:** An evaluation is conducted of external internet-facing systems for security weaknesses to determine if an attacker can gain access to sensitive information and compromise these systems.
- Wireless Penetration Testing:** An assessment of your organization's wireless implementations is conducted and recommendations are provided for improvement.
- Application Penetration Testing:** We focus on two primary objectives: containing unauthorized access and identifying sensitive information within applications.
- Social Engineering:** Phishing and vishing campaign tests benchmark vulnerabilities and enhance employee training.
