

# Improve the Efficiency of your Cable Modem Installations

*You can only make a first impression once. The Cable Modem Installer and Birth Certificate features in PreEqualization Analyzer make sure your first impression is a good one.*

## Improve the Success of Your Installations and Create A Great First Impression

### Install Modems Correctly the First Time

See where the test failed and take corrective action before leaving the install, ensuring every installation meets your system requirements.

### Generate a Birth Certificate to Track Installations

Generate a birth certificate that includes your technician's name, the test readings and a timestamp, allowing you to improve the quality of your installations.

### Save Money and Time

Improve the success of your installations, prevent repeat truck rolls and save money with our Cable Modem Installer feature.

### Increase Subscriber Satisfaction

Our PreEqualization Analyzer DOCSIS PNM tool helps you proactively avoid repeat service calls to new customers. It includes a Cable Modem Installer feature that allows your technician to ensure every installed device meets your system requirements. Best of all, there is no extra test equipment needed. All testing is run on our server using the customer's modem and your technician's smartphone.

Our Cable Modem Installer runs a series of tests that check for MER and power level issues after installation, as well key PNM metrics that determine whether the device is being impacted by micro-reflections or group delay.

### Who are We?

We help service providers reduce operational costs, increase staff efficiency and improve the quality of experience for the subscriber.
